Best Practices and Common Workflows

- **Commit Often:** Make frequent commits with descriptive messages to maintain a clear project history.
- **Branch for Features:** Create a new branch for each feature or bug fix to keep changes organized and separate from the main codebase.
- **Use Meaningful Commit Messages:** Write clear and concise commit messages that explain the purpose of the changes.
- **Pull Regularly:** Regularly pull changes from the remote repository to stay updated with the latest changes and minimize merge conflicts.
- **Resolve Conflicts Promptly:** Address merge conflicts as soon as they arise to avoid complicating the integration process.
- **Review Pull Requests Thoroughly:** Ensure thorough review of pull requests to maintain code quality and facilitate knowledge sharing.
- **Tag Releases:** Use tags to mark important milestones or releases in the project for easy reference in the future.
- **Keep Your Branches Clean:** Delete branches that are no longer needed after merging them into the main branch to keep the repository organized.
- **Use Git Hooks for Automation:** Utilize Git hooks to automate tasks, like running tests before committing (pre-commit) or checking commit message formats. Hooks can help ensure code quality and consistency.
- **Squash Commits Before Merging:** Squash commits to combine related work into a single commit before merging, especially for feature branches. This keeps the project history clean and manageable.
- **Avoid Large Commits:** Try to keep commits small and focused on a single change or fix. This makes it easier to understand the history and isolate issues if something goes wrong.
- **Create Descriptive Branch Names:** Use branch naming conventions that describe the purpose, such as feature/login-form or fix/user-authentication-bug. This improves readability and collaboration.
- **Keep the Main Branch Deployable:** Always ensure that the main or production branch is stable and deployable. This allows the project to be released or updated at any time.
